A vibrant red cardinal is perched on a weathered wooden post. The post is partially covered with a layer of snow. The background is a dark, blurred sky with numerous white snowflakes falling, creating a soft, wintry atmosphere. The cardinal is facing left, and its bright red feathers contrast sharply with the white snow and dark background.

Animals in Winter

What is the temperature like in these photographs?

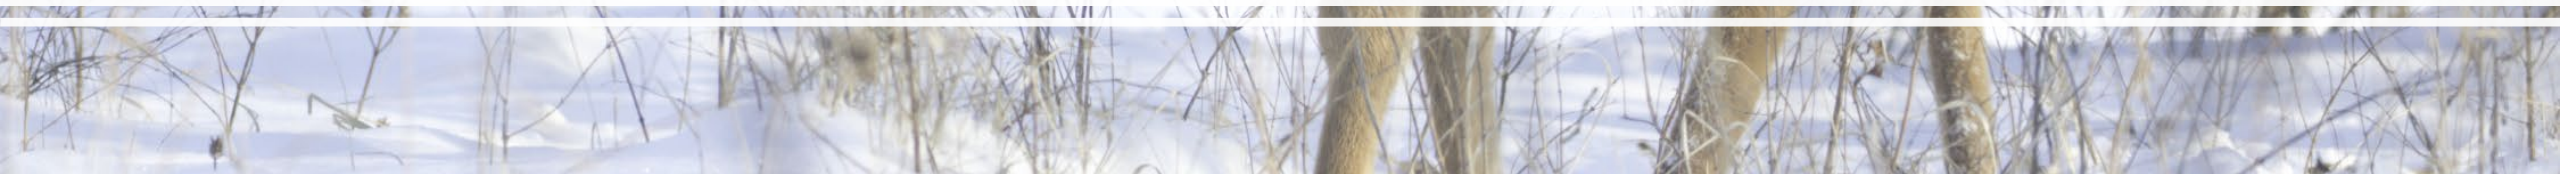

How do you think animals stay warm to survive during the winter?

How does the red fox stay warm?

What do deer have that helps them stay warm?

How do purple martins or Canada geese stay warm?

What about this fox sparrow and robin?
What are they doing to stay warm?

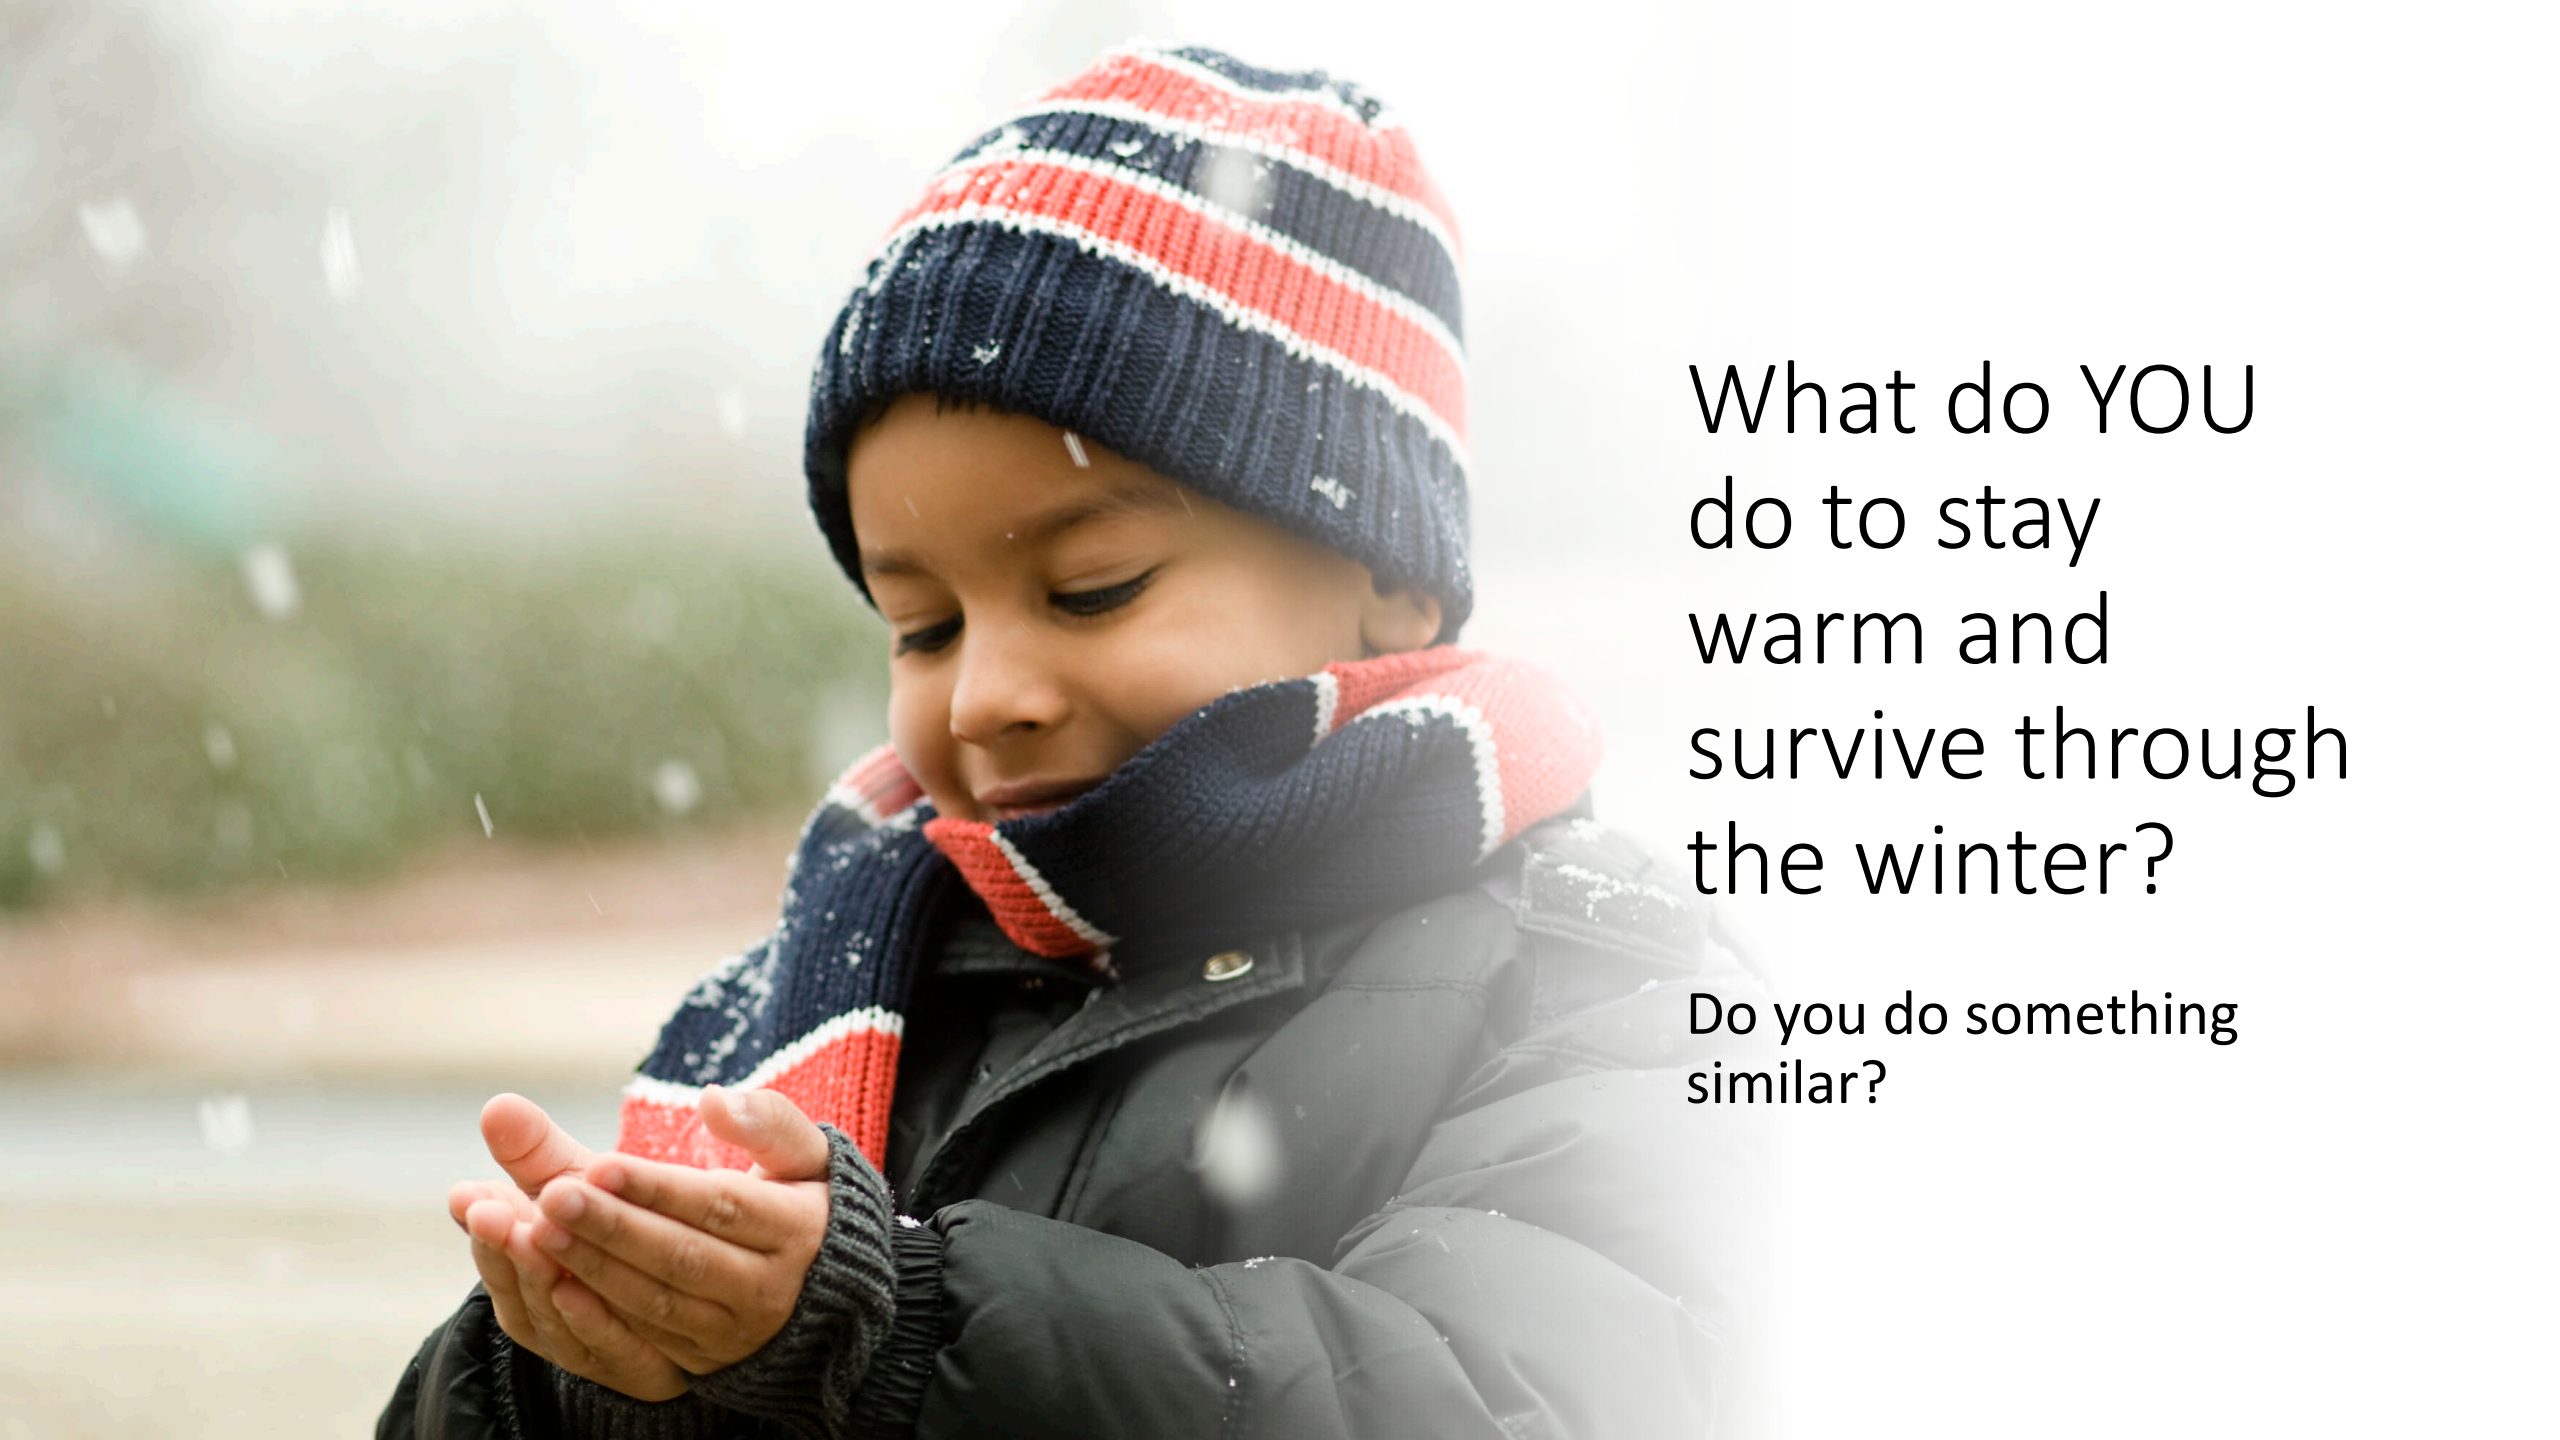

What are the fox and grey squirrels doing to stay warm?

And what
about this little
red bat and
black bear?

Hint: You do this every night,
but they do it all winter long!

What do YOU
do to stay
warm and
survive through
the winter?

Do you do something
similar?
